PROFESSIONAL SUMMARY

Backend-focused Software Developer and SDET with hands-on experience building automation tools, test automation frameworks, production-grade data pipelines, and full-stack web applications. Experienced in developing scalable Python, Java, JavaScript, and TypeScript-based workflows for UI testing, API testing, backend validation, data extraction, transformation, and structured content operations. Reduced manual data entry by up to 80% across 1,000+ listings through automation-driven solutions. Strong foundation in backend systems, test automation, CI/CD, SQL validation, REST API testing, and real-world problem solving, with practical experience using tools such as Selenium, Playwright, Cucumber, Postman, Docker, Git, and GitHub Actions.

TECHNICAL SKILLS

Languages: Java, JavaScript, TypeScript, Python, C++, SQL, HTML/CSS

Test Automation: Selenium WebDriver, Playwright, Cucumber BDD, JUnit, TestNG, pytest, Page Object Model, Data-Driven Testing

API Testing: REST APIs, Postman, RestAssured, JSON/XML validation, API contract testing basics

Frameworks & Libraries: Next.js, React, Tailwind CSS, Pandas, BeautifulSoup

CI/CD & Build Tools: GitHub Actions, Jenkins, Maven, Gradle, CI/CD basics

Infrastructure: Docker, Docker Compose, Caddy, Cloudflare Tunnel, Cloudflare, Nginx

Tools & Platforms: Git, GitHub, VS Code, IntelliJ IDEA, WordPress, Vercel, Jira

Databases: MySQL, PostgreSQL, SQL queries, data validation, backend database testing

APIs & Integrations: REST APIs, Telegram Bot API, Resend API, MCP

Core Concepts: Data Structures, Algorithms, OOP, Operating Systems, Agile/Scrum, SDLC, STLC, defect lifecycle, regression testing, smoke testing, functional testing, integration testing

PROFESSIONAL EXPERIENCE

Software Developer – Part Time Contract

The Federation of Rental-Housing Providers of Ontario (FRPO) | Toronto, ON | Nov 2025 – Present

- Engineered scalable data pipelines using Python to extract, parse, and transform raw HTML data from multiple property management sources into structured formats (CSV/XLSX) for CMS ingestion.
- Reduced manual data entry by 65–80% by automating scraping, transformation, and bulk import workflows across high-volume datasets.
- Processed and maintained over 1,000 property listings, ensuring high accuracy, consistency, and structured data mapping across the platform.
- Designed data cleaning and validation processes to resolve inconsistencies across multiple external data sources.
- Managed large-scale content operations within WordPress (WP-Property), including updates, corrections, and structured field mapping.
- Collaborated directly with stakeholders to identify inefficiencies and implement automation-driven solutions.

SDET

TripArc | Toronto, ON | Jun 2020 – Aug 2025

- Designed, developed, and maintained automated test frameworks for TripArc's ADX travel booking platform, validating end-to-end workflows across air, hotel, cruise, insurance, activities, itinerary builder, invoicing, and reporting modules.
- Built scalable UI and API automation tests to ensure travel advisors could search, compare, book, invoice, generate statements, track commissions, and manage client itineraries reliably within a single platform.
- Automated regression, smoke, integration, and functional test suites for booking flows involving suppliers, travel agencies, airlines, hotels, cruise providers, DMCs, and tour operators.

- Validated complex travel-domain business rules, including commission calculations, service fees, markups, rate availability, booking confirmations, itinerary changes, invoice generation, and advisor/client reporting.
- Collaborated with product owners, developers, QA engineers, and support teams to clarify requirements, identify risks, and deliver high-quality features aligned with TripArc's focus on productivity, profitability, and reduced booking friction.
- Developed API-level test coverage for supplier integrations, inventory search, booking request management, rate retrieval, financial reporting, and client/advisor data workflows.
- Created automated tests for notification and travel support scenarios, including itinerary updates, passport expiry alerts, upcoming travel reminders, schedule changes, and post-booking workflows.
- Integrated automated test execution into CI/CD pipelines to provide fast feedback on code changes and support frequent releases in an agile travel technology environment.
- Performed root-cause analysis of automation failures and production defects, improving test reliability, defect detection, and platform stability.
- Supported cross-browser and responsive UI testing to ensure ADX remained intuitive, user-friendly, and reliable for travel professionals with minimal training needs.
- Partnered with development teams to improve testability, define acceptance criteria, review technical designs, and promote shift-left quality practices.
- Maintained test data strategies for booking, supplier, advisor, client, invoice, commission, and reporting scenarios to support repeatable automated testing.
- Contributed to quality improvements for a platform supporting large-scale travel booking volume and complex multi-supplier travel content. TripArc states its technology supports nearly \$1B in booking volume annually and connects hotels, airlines, cruise lines, DMCs, tour operators, and travel agencies.

PERSONAL PROJECTS

Portfolio Website | Next.js, TypeScript, Tailwind CSS

- Developed a responsive full-stack portfolio application using Next.js and TypeScript, showcasing projects and technical capabilities.
- Built modular, reusable UI components with Tailwind CSS, supporting responsive design and consistent user experience across devices.
- Deployed using Docker Compose, Caddy, and Cloudflare Tunnel, creating a self-hosted production environment with reverse proxy routing and origin protection.
- Implemented a secure contact system with server-side validation, rate limiting, and email delivery using Resend, including structured request logging.

AI-Assisted Server Monitoring Tool | TypeScript, MCP, OpenClaw, Telegram

- Designed and implemented a Model Context Protocol (MCP) server exposing real-time system data including Docker services, repository state, and deployment configurations.
- Integrated a self-hosted AI agent with Telegram to enable remote querying and monitoring of infrastructure through conversational commands.
- Developed a log-based monitoring system that processes Caddy access logs, filters human traffic using deterministic heuristics, and sends real-time alerts.

Budget Tracking App - Smart Spender | Java, Android

- Collaborated in a 4-person Agile team to develop a mobile budgeting application with income, expense, and category tracking features.
- Implemented core financial tracking modules enabling real-time updates and multi-category budget management.
- Designed and improved an interactive dashboard to enhance financial visibility and usability.
- Conducted cross-device testing and resolved UI/performance issues to ensure consistent user experience.

EDUCATION

York University - Toronto, ON

Bachelor of Science (Honours), Computer Science
